

Underwater cameras

With fish growers facing tighter environmental restrictions and increased operating costs, the under water camera system is currently assisting cage production sites to monitor fish stocks, with an aim to improve the feeding of the fish. With a minimum of training, our under water camera units will soon become a useful tool, reassuring fish crews when surface response to feed is at a minimum. The risk of wasted feed is minimized, reducing feeding costs.

Models available;

- fixed camera facing up for feeding
- fixed camera facing up and down, feeding and inspection of mortis
- pan and tilt camera; complete inspection of the cage

Cameras can be mounted with a movable monitor cart to be used at various locations. Stationary systems can either be assembled with permanent cabling and/or radio modems. This enables you to continuously monitor your fish/feeding from your office.

Camera systems can be integrated in the Ocea feedsystem.
